The Terminal

FEAR NOT THE COMMAND LINE

// FLATIRON SCHOOL

LEARNING OBJECTIVES

// Utilize bash commands through a terminal interface

// Use the terminal to list, make, move and remove files and directories

// Use the terminal to navigate between files/directories and open Jupyter notebooks or other files

// Edit text files using vim

Terminal? Shell? Command Line?

- Many terms - all different but similar
  - Ultimately: we use the **Command Line** to enter text prompts and interact with the **Shell** interface, which is run by the **Terminal**
  - Realistically: these terms are often used interchangeably
- In the Flatiron Data Science program, we use:
  - Terminal Programs:
    - Mac - **Terminal** application
    - Windows - **Git Bash**
  - Shell options: **bash** / **zsh**

Basic Commands

```
$ pwd
    display the current working directory of
    the shell

$ ls
    list the files and directories of the current
    directory

$ cd
    change the directory to update the
    current working directory
```
Paths - Absolute or Relative?

- **Absolute:**

    starts from root (/) or home (~)

- **Relative:**

    starts from your current working
    directory (where you are)

Prompt:

Given the file directory structure pictured above, what are the two versions of the path to the **Projects** folder, if you're currently in **Materials**?

Special Directories

/ root, the top-level directory

~ your home directory

. the current directory

.. the parent directory (one level up)

Basic Commands

```
$ touch
```
    create a new file

```
$ mkdir
```
    create a new directory

```
$ mv
```
    move a file from source to destination
    (also used to rename files/directories)

```
$ rm
```
    remove a file from the file system
    (BE CAREFUL!)

Prompt: Make Your Flatiron Folder!

- Using only the Terminal, make a Flatiron folder where you can keep all program-related files and materials (if you haven't already)

  - Suggestion: Put it somewhere logical! In Documents or Desktop, perhaps

- Practice opening a new Terminal window and navigating to that folder!

LET'S GET
ORGANIZED

Text Editors

- Nice to use a GUI (graphical user interface) code-focused text editor
  - No matter which you use, configure that text editor so it can open easily from the command line!
  - If you use VS Code:
    - `code .` : open the current working directory
    - `code <FILENAME>` : open that file
    - (Macs: need to set up)
- Sometimes, you have to use a CLI text editor… enter **VIM**

Surviving VIM

Two Modes:

- **Insert** mode

  - Type normally to add/edit text

  - Enter by pressing `i`

- **Command** mode

  - Each key is a command

  - Enter by pressing `ESC key`

Basic VIM Commands (used in Command mode)

`i`   enter Insert mode

`A`   enter Insert mode at the end of the line

`ESC`   return to Command mode

`dd`   delete the current line

`u`   undo last change

`:wq`   save and quit

`:q!`   force quit without saving
